MOVIE RATING PREDICTION WITH PYTHON

Problem Statement:-

"Develop a Python-based model to predict movie ratings based on various features. Utilize machine learning algorithms to analyze historical
movie data, extracting patterns and relationships to make accurate predictions. The model aims to assist movie producers and distributors in
forecasting audience reception, optimizing marketing strategies, and maximizing box office success."

```
import pandas as pd
            import numpy as np
            import matplotlib.pyplot as plt
            import seaborn as sns
            import plotly.express as px

Insights:-

- all 5 rating movies list = 480
- all 5 rating movies list and Age Less Then 25 count = 208
- all movies rating less than 3 list and Age Lass Then 25 count = 47163
- Top Movie Genres is Drama
- Top Rated movies is jumanji
- Average age distribution for movie rating is 25 years
- Most of the ratings are done by Mens

Conclusion:-

Upon evaluating various performance metrics for movie rating prediction models, Logistic Regression emerges as the top-performing model. It exhibits the highest cross-validated score, accuracy, precision, recall, F1 score, and ROC AUC among the considered models. Thus, Logistic Regression stands out as the most suitable choice for predicting movie ratings, offering robust performance across multiple evaluation criteria.
